

Light Pollution in Europe

What is light pollution?

Light pollution is the excessive or misdirected artificial light that brightens the night sky, reducing visibility of stars and disrupting natural ecosystems. It is caused by artificial sources such as streetlights, buildings, and signage that unnecessarily emit light upwards or stay illuminated. Light pollution not only affects astronomical observations but also impacts wildlife behaviour and human health by disturbing natural sleep cycles. Reducing it involves using properly shielded lighting and minimising unnecessary night-time illumination.

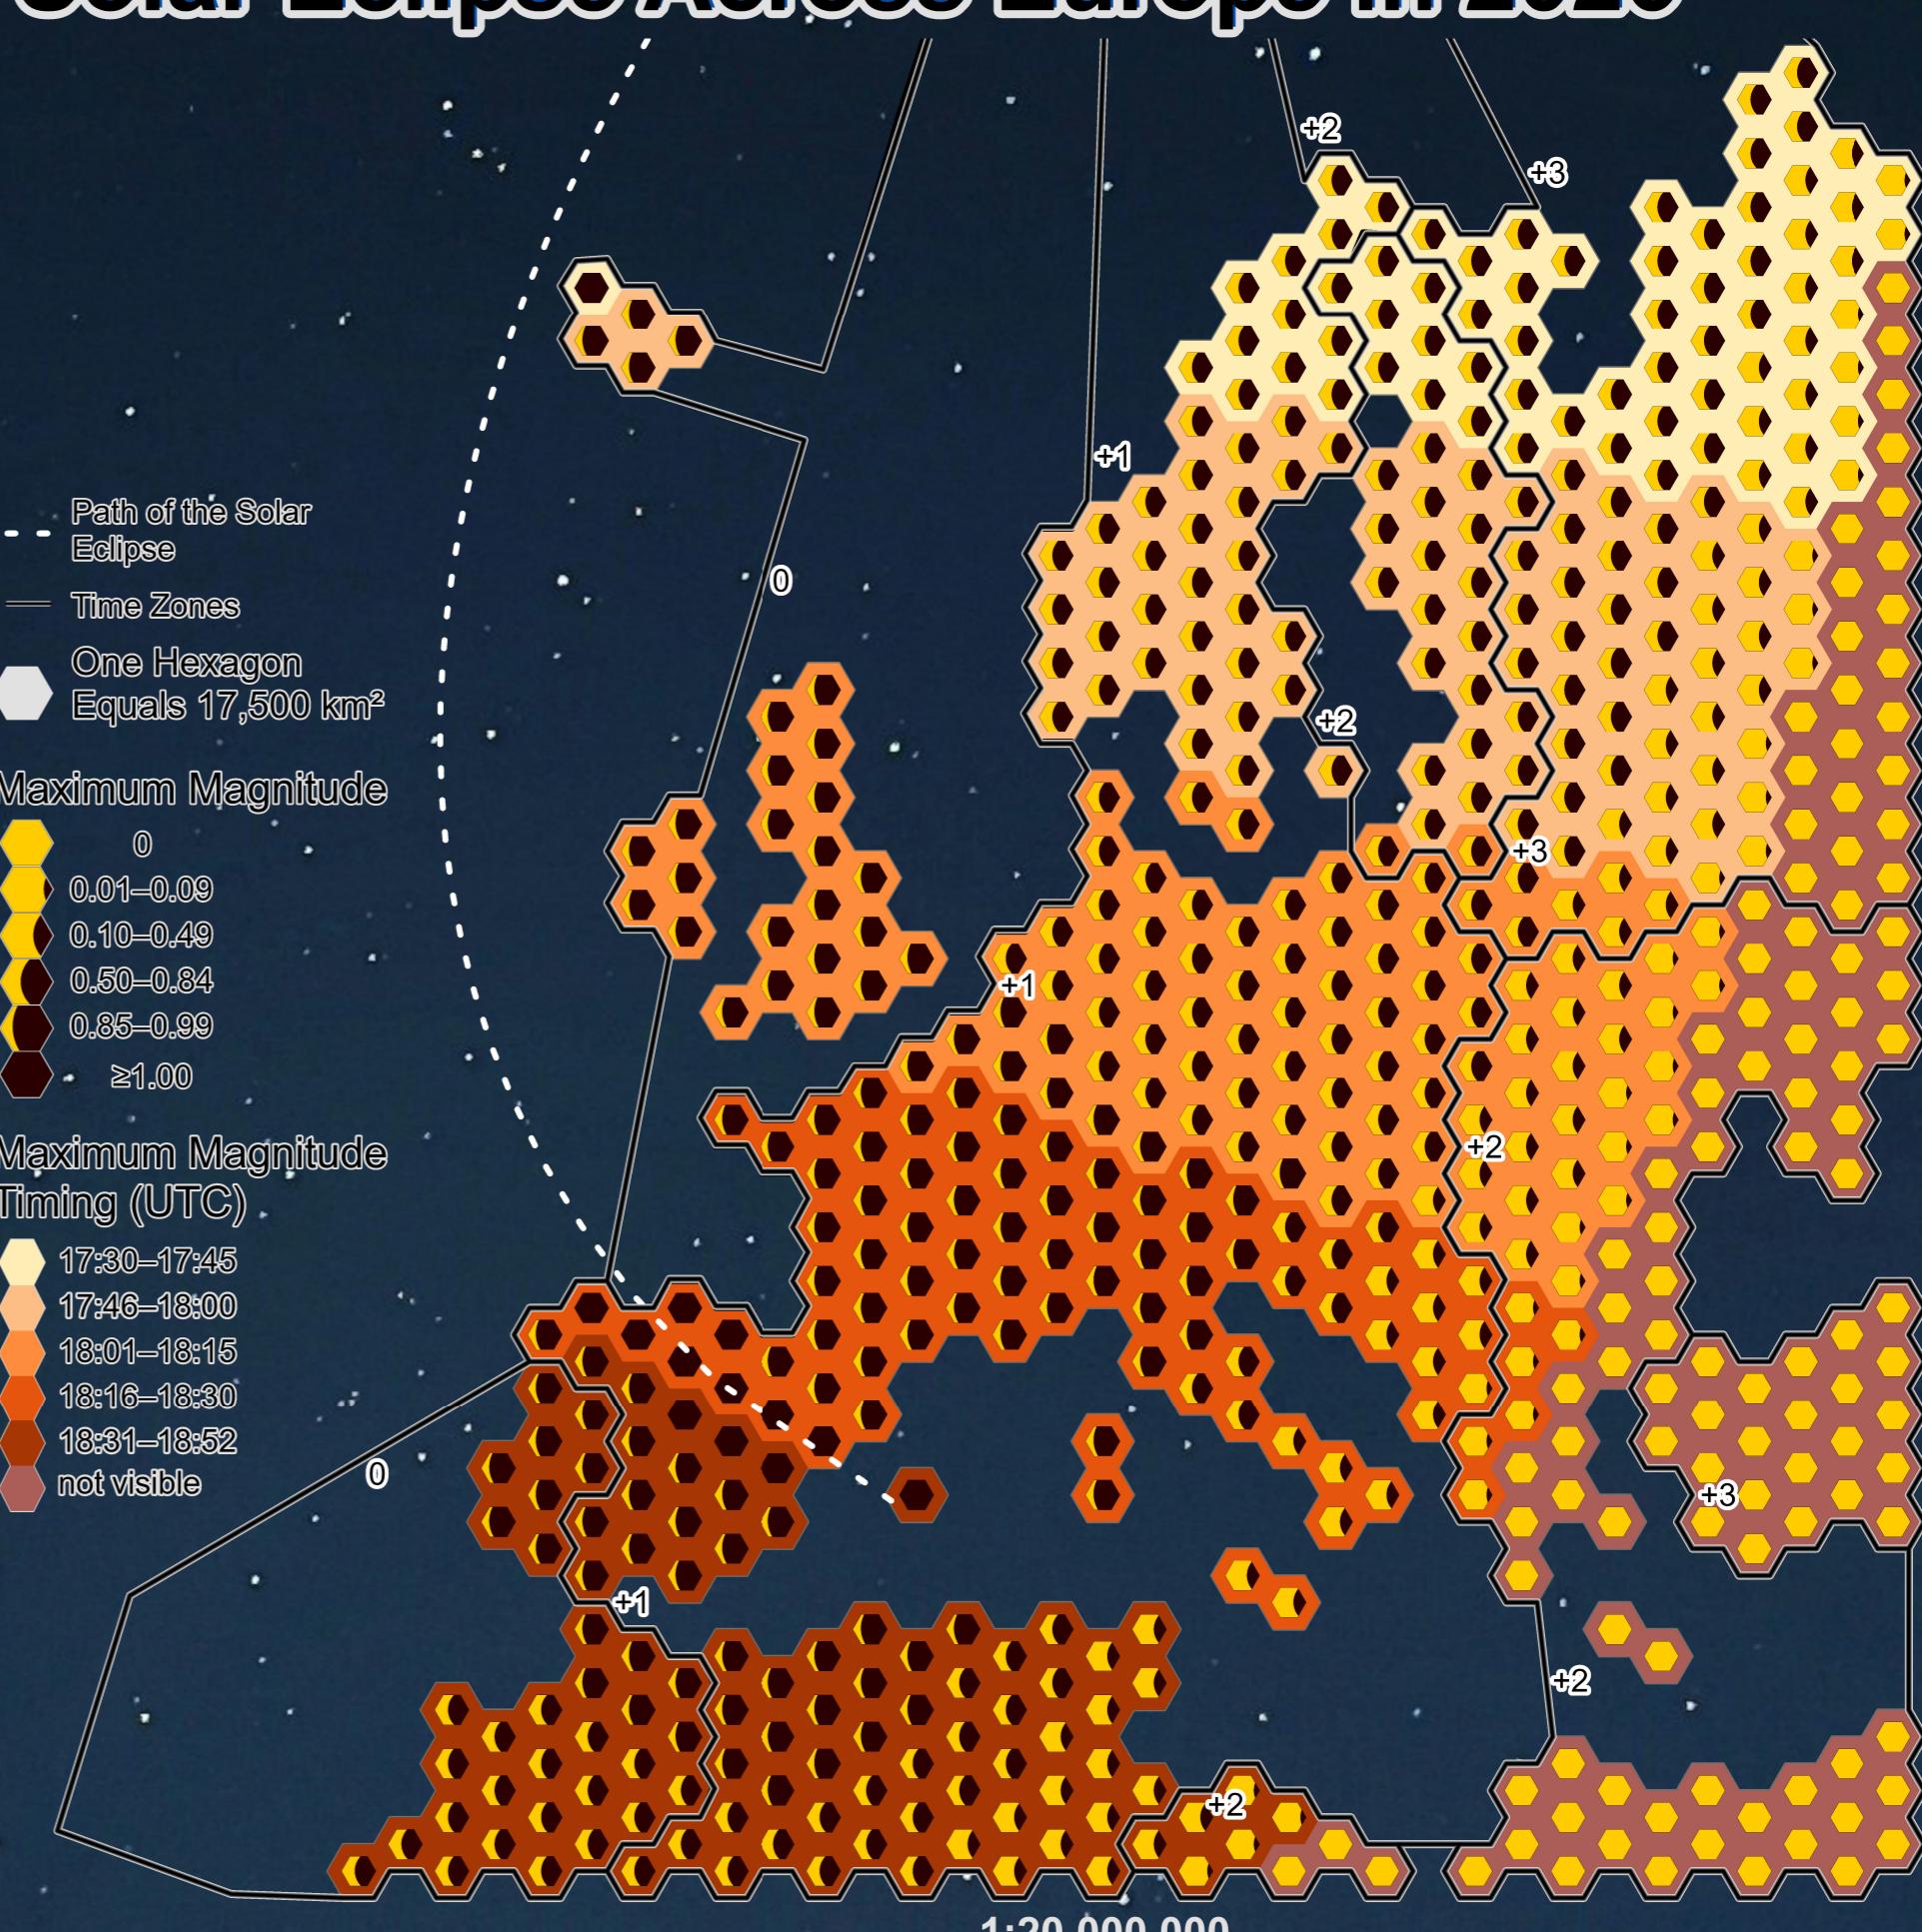

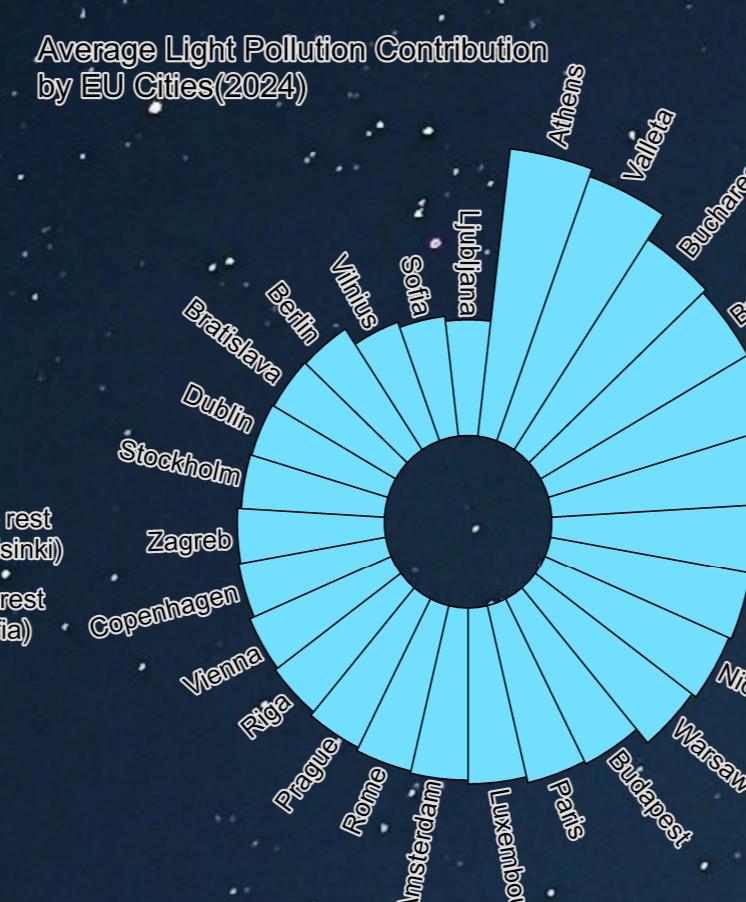

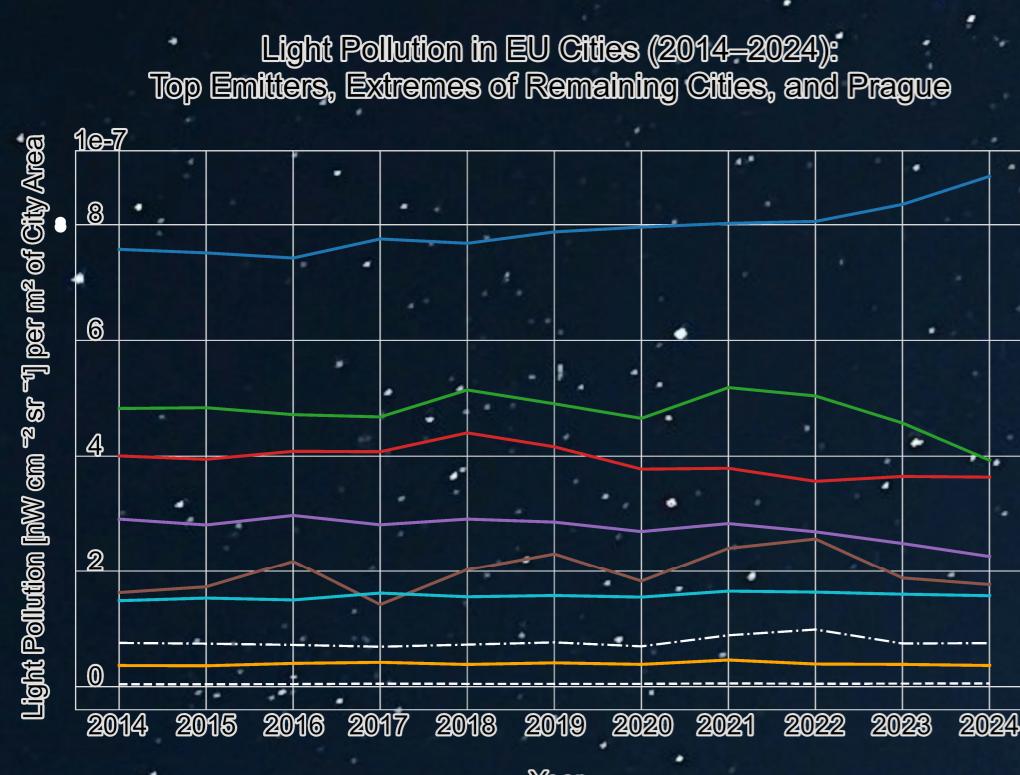

Total Solar Eclipse Across Europe in 2026

Data acquisition process

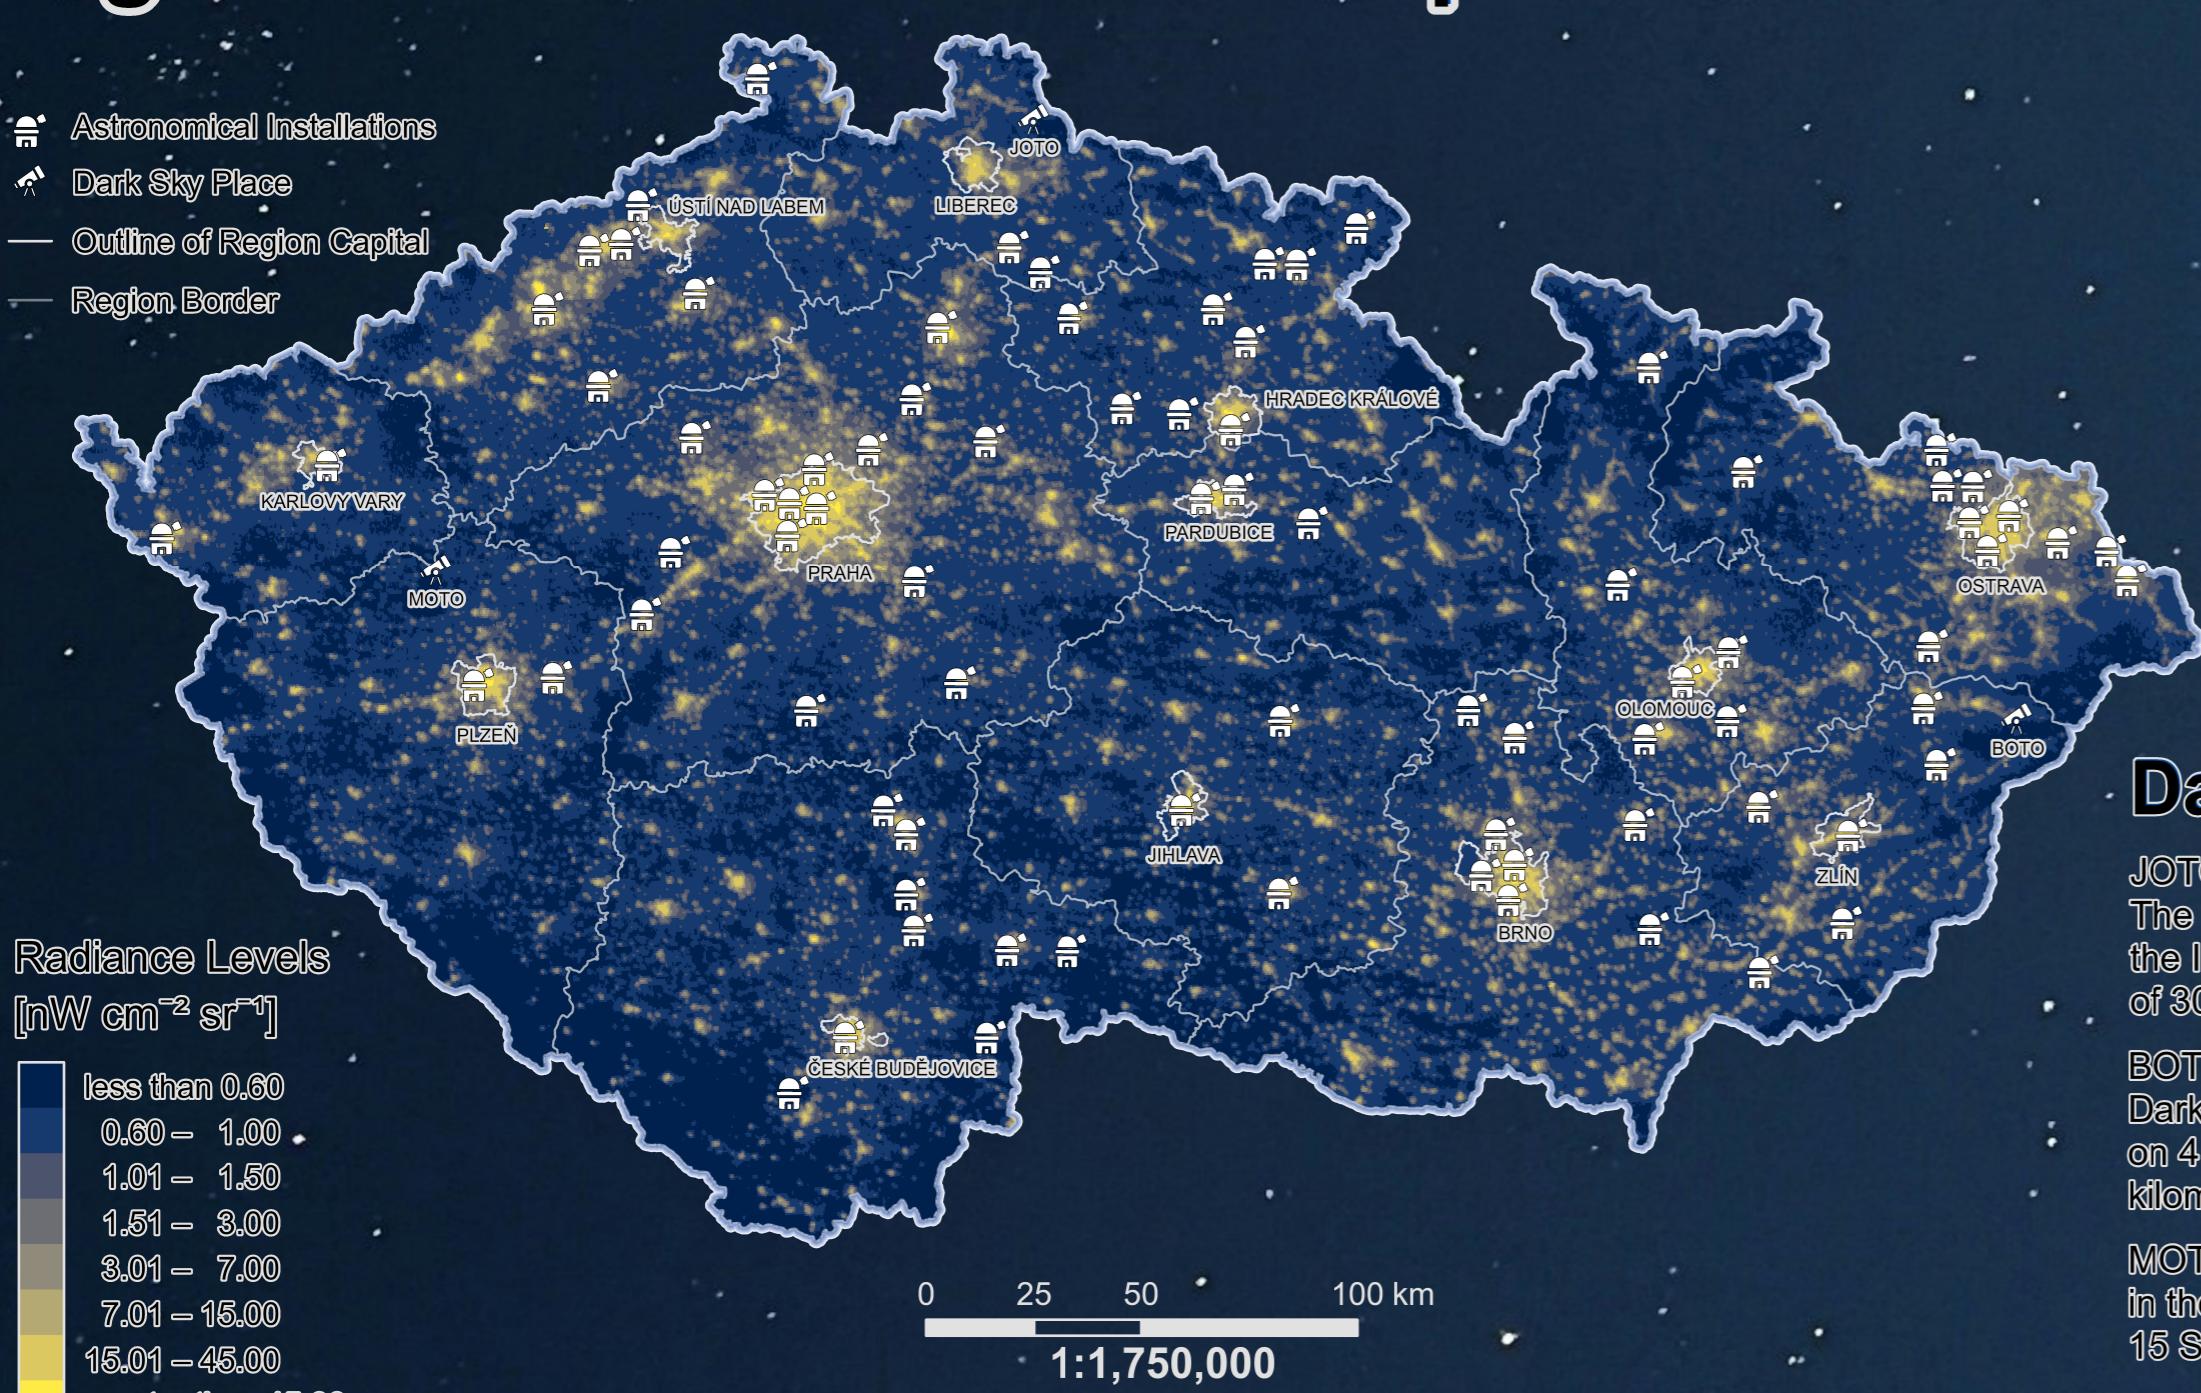

To accurately measure the brightness of the night sky (particularly in the context of light pollution studies), night-time satellite imagery of the Earth is used to capture the number and intensity of artificial light sources across the planet. The most important satellites collecting this data are those equipped with the VIIRS Day/Night Band (DNB) sensor.

The raw data from these satellites is measured in radiance and is typically expressed in units of $\text{W m}^{-2} \text{sr}^{-1}$ (watts per square metre per steradian). This unit indicates the amount of light energy emitted or reflected per unit area (m^2) in a specific direction (solid angle in steradians). It is a physical measurement of emitted light power, independent of human perception.

The radiance measured in $\text{W m}^{-2} \text{sr}^{-1}$ is useful for scientific analysis, while other units, such as candelas per square metre (cd/m^2) or magnitudes per square arcsecond (mag/arcsec^2), are used to express how bright the sky appears to the human eye or how it affects astronomical visibility.

Light Pollution in the Czech Republic in 2024

Dark sky places in the Czech Republic

JOTO (Jizerska Dark Sky Park) is the first of its kind in the world. The park was officially declared on 4 November 2009, during the International Year of Astronomy. It extends across an area of 308 square kilometres in the Czech Republic and Poland.

BOTO (Beskydy Dark-Sky Park) is the second International Dark Sky Park in the world. The park was officially declared on 4 March 2013. It extends across an area of 308 square kilometres in the Czech Republic and Slovakia.

MOTO (Manětínský Dark Sky Park) is the first park completely in the Czech Republic. The park was officially declared on 15 September 2014. It covers an area of 346 km².
